Hear presentations by key plant geneticists and practitioners regarding the current best understanding of native seed provenance issues for planning and implementing ecological restoration. In particular, this will be relevant to plant population structures, decline, distribution and gene flows acknowledging climate variability.

The workshop aims to empower participants with knowledge of the implications and potential solutions for project planning, seedsourcing and related logistics of genetic tracking. It will also discuss monitoring for long-term success, resilience and sound investment in projects. And seek to answer the question - what is the definition of 'local provenance'?

The target audience is Local Land Services project managers and staff, project partners, seed suppliers, nurseries, restoration contractors, landcare groups, landholders and anyone interested in native plants or conservation.
